Free Algebras

Question

What does it mean for a mathematical structure to be free?

Free Algebras

Question

What does it mean for a mathematical structure to be free?

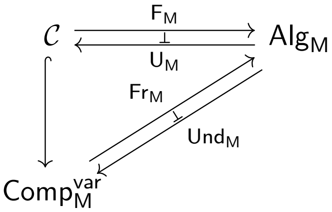
$$\mathcal{C} \underset{\mathsf{U_M}}{\overset{\mathsf{F_M}}{\underset{\longleftarrow}{\overset{\longrightarrow}{\bot}}}} \mathsf{Alg_M}$$

- Structures are M-algebras and free are in the image of $\mathsf{F_M}$.

Free Algebras

Question

What does it mean for a mathematical structure to be free?

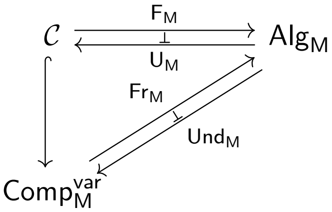


- Structures are M-algebras and free are in the image of F_M.
- For some M, there are more general generating data for free algebras.

Free Algebras

Question

What does it mean for a mathematical structure to be free?



- Structures are M-algebras and free are in the image of F_M.
- For some M, there are more general generating data for free algebras.
  - Free strict 2-category monad[2]

[2] Street, "Limits indexed by category-valued 2-functors"

$$ss = st \qquad ts = tt$$

  where X_1^* is the set of formal composites from X_1.

- The free 2-category on X consists of formal composite and coherence cells quotiented by the laws of 2-categories.

Free Monads

Question

Monads are mathematical structures. When is a monad free?

Free Monads

Question

Monads are mathematical structures. When is a monad free?

Idea

It should correspond to a theory with no equations when $\mathcal{C} = [\mathcal{I}^{\mathrm{op}}, \mathrm{Set}]$.

- weak ω-cateogories
- algebraic Kan complexes / quasicategories

Free Monads

Question

Monads are mathematical structures. When is a monad free?

Idea

It should correspond to a theory with no equations when $\mathcal{C} = [\mathcal{I}^{\mathrm{op}}, \mathrm{Set}]$.

- weak ω-cateogories
- algebraic Kan complexes / quasicategories

Definition

A signature[4] over $\mathcal{C} = [\mathcal{I}^{\mathrm{op}}, \mathrm{Set}]$ is a presheaf $\Sigma \in \mathcal{C}$ of function symbols with arity functions $B_\bullet : \Sigma_i \to \mathrm{ob}\,\mathcal{C}$ satisfying for $\delta : j \to i$ that

$$B_{\delta^* f} = B_f$$

[4] Bourke and Garner, "Monads and theories"

Algebras of a signature

Definition

A Σ-algebra $\mathbb{X}$ is a presheaf X equipped with functions

$$f^{\mathbb{X}} : \mathcal{C}(B_f, X) \to X_i$$

for $f \in \Sigma_i$ satisfying that $\delta^* \circ f^{\mathbb{X}} = (\delta^* f)^{\mathbb{X}}$ for $\delta : j \to i$.

- The forgetful functor $\mathrm{U}_\Sigma : \mathrm{Alg}_\Sigma \to \mathcal{C}$ is strict monadic.
- The free monad on Σ is $\mathrm{M}_\Sigma = \mathrm{U}_\Sigma \mathrm{F}_\Sigma$.

Algebras of a signature

Definition

A Σ-algebra $\mathbb{X}$ is a presheaf X equipped with functions

$$f^{\mathbb{X}} : \mathcal{C}(B_f, X) \to X_i$$

for $f \in \Sigma_i$ satisfying that $\delta^* \circ f^{\mathbb{X}} = (\delta^* f)^{\mathbb{X}}$ for $\delta : j \to i$.

- The forgetful functor $\mathrm{U}_\Sigma : \mathrm{Alg}_\Sigma \to \mathcal{C}$ is strict monadic.
- The free monad on Σ is $\mathrm{M}_\Sigma = \mathrm{U}_\Sigma \mathrm{F}_\Sigma$.

Problem

Weak ω-categories are not algebras of a signature, since the source of the associator is not an 1-dimensional function symbol, but a composite of them.

Table of Contents

Direct Categories

Definition

A direct category $\mathcal{I}$ is a small category equipped with a dimension function $\dim : \mathrm{ob}\,\mathcal{I} \to \mathrm{Ord}$ to the class of ordinals such that $\dim j < \dim i$ for every non-identity morphism $\delta : j \to i$.

Direct Categories

Definition

A direct category $\mathcal{I}$ is a small category equipped with a dimension function $\dim : \mathrm{ob}\,\mathcal{I} \to \mathrm{Ord}$ to the class of ordinals such that $\dim j < \dim i$ for every non-identity morphism $\delta : j \to i$.

Example

- Any discrete category S.

Direct Categories

Definition

A direct category $\mathcal{I}$ is a small category equipped with a dimension function $\dim : \mathrm{ob}\,\mathcal{I} \to \mathrm{Ord}$ to the class of ordinals such that $\dim j < \dim i$ for every non-identity morphism $\delta : j \to i$.

Example

- Any discrete category S.
- The category $\mathbb{G}$ of globes

$$[0] \underset{t}{\overset{s}{\rightrightarrows}} [1] \underset{t}{\overset{s}{\rightrightarrows}} [2] \underset{t}{\overset{s}{\rightrightarrows}} \cdots$$

$$ss = ts$$
$$st = tt$$

Direct Categories

Definition

A direct category $\mathcal{I}$ is a small category equipped with a dimension function $\dim : \mathrm{ob}\,\mathcal{I} \to \mathrm{Ord}$ to the class of ordinals such that $\dim j < \dim i$ for every non-identity morphism $\delta : j \to i$.

Example

- Any discrete category S.
- The category $\mathbb{G}$ of globes
- The category Δ_{inj} of simplices and face maps.

$$[0] \underset{\delta_1}{\overset{\delta_0}{\rightrightarrows}} [1] \underset{\delta_2}{\overset{\delta_0}{\Rrightarrow}} [2] \underset{\delta_3}{\overset{\delta_0}{\rightrightarrows\!\rightrightarrows}} \cdots \qquad \delta_i\delta_j = \delta_{j+1}\delta_i \quad (i \leq j)$$

Direct Categories

Definition

A direct category $\mathcal{I}$ is a small category equipped with a dimension function $\dim : \mathrm{ob}\,\mathcal{I} \to \mathrm{Ord}$ to the class of ordinals such that $\dim j < \dim i$ for every non-identity morphism $\delta : j \to i$.

Example

- Any discrete category S.
- The category $\mathbb{G}$ of globes
- The category Δ_{inj} of simplices and face maps.

Notation

We denote by $\mathcal{I}_\alpha$ the full subcategory on objects of dimension at most α with the obvious dimension function.

The inductive data

We define by transfinite recursion on $\alpha \leq \sup\{\dim i \ : \ i \in \mathcal{I}\}$

- a class $\mathsf{Sig}_\alpha(\mathcal{I})$ of (generalised) signatures of dimension α,

The inductive data

We define by transfinite recursion on $\alpha \leq \sup\{\dim i \ : \ i \in \mathcal{I}\}$

- a class $\mathsf{Sig}_\alpha(\mathcal{I})$ of (generalised) signatures of dimension α,
- restriction functions $\mathsf{Sig}_\alpha(\mathcal{I}) \xrightarrow{(-)_\beta} \mathsf{Sig}_\beta(\mathcal{I})$ for $\beta < \alpha$

The inductive data

We define by transfinite recursion on $\alpha \leq \sup\{\dim i \ : \ i \in \mathcal{I}\}$

- a class $\mathsf{Sig}_\alpha(\mathcal{I})$ of (generalised) signatures of dimension α,
- restriction functions $\mathsf{Sig}_\alpha(\mathcal{I}) \xrightarrow{(-)_\beta} \mathsf{Sig}_\beta(\mathcal{I})$ for $\beta < \alpha$
- an adjunction for every signature Σ of dimension α

$$[\mathcal{I}_\alpha^{\mathsf{op}}, \mathsf{Set}] \underset{\mathsf{Term}_\Sigma}{\overset{\mathsf{Cptd}_\Sigma}{\underset{\longleftarrow}{\overset{\longrightarrow}{\bot}}}} \mathsf{Comp}_\Sigma$$

The inductive data

We define by transfinite recursion on $\alpha \leq \sup\{\dim i \ : \ i \in \mathcal{I}\}$

- a class $\mathsf{Sig}_\alpha(\mathcal{I})$ of (generalised) signatures of dimension α,
- restriction functions $\mathsf{Sig}_\alpha(\mathcal{I}) \xrightarrow{(-)_\beta} \mathsf{Sig}_\beta(\mathcal{I})$ for $\beta < \alpha$
- an adjunction for every signature Σ of dimension α

$$[\mathcal{I}_\alpha^{\mathsf{op}}, \mathsf{Set}] \underset{\mathsf{Term}_\Sigma}{\overset{\mathsf{Cptd}_\Sigma}{\underset{\longleftarrow}{\overset{\longrightarrow}{\bot}}}} \mathsf{Comp}_\Sigma$$

- truncation functors $\mathsf{Comp}_\Sigma \xrightarrow{\mathsf{tr}_\beta^\Sigma} \mathsf{Comp}_{\Sigma_\beta}$ for every $\beta < \alpha$

Signatures

Definition

A signature Σ of dimension α consists of

- signatures Σ_β for $\beta < \alpha$ such that $(\Sigma_\beta)_\gamma = \Sigma_\gamma$,

Signatures

Definition

A signature Σ of dimension α consists of

- signatures Σ_β for $\beta < \alpha$ such that $(\Sigma_\beta)_\gamma = \Sigma_\gamma$,
- sets Σ_i of function symbols for $\dim i = \alpha$,

Signatures

Definition

A signature Σ of dimension α consists of

- signatures Σ_β for $\beta < \alpha$ such that $(\Sigma_\beta)_\gamma = \Sigma_\gamma$,
- sets Σ_i of function symbols for $\dim i = \alpha$,
- for every function symbol $f \in \Sigma_i$,

Signatures

Definition

A signature Σ of dimension α consists of

- signatures Σ_β for $\beta < \alpha$ such that $(\Sigma_\beta)_\gamma = \Sigma_\gamma$,
- sets Σ_i of function symbols for dim $i = \alpha$,
- for every function symbol $f \in \Sigma_i$,
  - an arity $B_f \in [\mathcal{I}^{\mathrm{op}}, \mathrm{Set}]$

Signatures

Definition

A signature Σ of dimension α consists of

- signatures Σ_β for $\beta < \alpha$ such that $(\Sigma_\beta)_\gamma = \Sigma_\gamma$,
- sets Σ_i of function symbols for $\dim i = \alpha$,
- for every function symbol $f \in \Sigma_i$,
  - an arity $B_f \in [\mathcal{I}^{\mathrm{op}}, \mathrm{Set}]$
  - for non-identity $\delta : j \to i$, a boundary term

$$\delta^* f \in \mathrm{Term}_{\Sigma_{\dim j}, j}\, \mathrm{Cptd}_{\Sigma_{\dim j}}(\mathrm{tr}_{\dim j} B_f)$$

satisfying that $(\delta')^*(\delta^* f) = (\delta\delta')^* f$

The restriction functions are the obvious projections.

Computads

Definition

A Σ-computad C consists of

- Σ_β-computads C_β for $\beta < \alpha$ such that $\mathrm{tr}_\gamma^{\Sigma_\beta} C_\beta = C_\gamma$,

Computads

Definition

A Σ-computad C consists of

- Σ_β-computads C_β for $\beta < \alpha$ such that $\mathrm{tr}_\gamma^{\Sigma_\beta} C_\beta = C_\gamma$,
- a set V_i^C of generators for $\dim i = \alpha$,

Computads

Definition

A Σ-computad C consists of

- Σ_β-computads C_β for $\beta < \alpha$ such that $\mathrm{tr}_\gamma^{\Sigma_\beta} C_\beta = C_\gamma$,
- a set V_i^C of generators for $\dim i = \alpha$,
- gluing functions $V_i^C \to \mathrm{Term}_{\Sigma_{\dim j}, j}(C_{\dim j})$ for non-identity $\delta : j \to i$ such that

$$(\delta')^* \phi_\delta^C = \phi_{\delta\delta'}^C$$

Computads

Definition

A Σ-computad C consists of

- Σ_β-computads C_β for $\beta < \alpha$ such that $\mathrm{tr}_\gamma^{\Sigma_\beta} C_\beta = C_\gamma$,
- a set V_i^C of generators for $\dim i = \alpha$,
- gluing functions $V_i^C \to \mathrm{Term}_{\Sigma_{\dim j}, j}(C_{\dim j})$ for non-identity $\delta : j \to i$ such that

$$(\delta')^* \phi_\delta^C = \phi_{\delta\delta'}^C$$

Each presheaf $X : \mathcal{I}_\alpha^{\mathrm{op}} \to \mathrm{Set}$ defines a computad by

$$(\mathrm{Cptd}_\Sigma X)_\beta = \mathrm{Cptd}_{\Sigma_\beta} \mathrm{tr}_\beta X$$
$$V_i^{\mathrm{Cptd}_\Sigma X} = X_i$$
$$\phi_\delta^{\mathrm{Cptd}_\Sigma X} = \eta_{\Sigma_{\dim j}} \circ \delta^*$$

Terms

Definition

The lower dimensional terms of a computad C are those of the computads C_β. The set $\mathsf{Term}_{\Sigma,i}\, C$ for $\dim i = \alpha$ is inductively generated by

- $\mathsf{var} : V_i^C \to \mathsf{Term}_{\Sigma,i}\, C$
- $\mathsf{comp} : \sum_{f \in \Sigma_i} \mathsf{Comp}_\Sigma(\mathsf{Cptd}_\Sigma\, B_f, C) \to \mathsf{Term}_{\Sigma,i}\, C$

Terms form a presheaf by letting for $\delta : j \to i$

$$\delta^*(\mathsf{var}\, v) = \phi_\delta^C(v)$$
$$\delta^*(\mathsf{comp}[f,\tau]) = \mathsf{Term}_{\Sigma_{\dim j},j}(\tau_{\dim j})(\delta^* f)$$

Morphisms of computads

Definition

A morphism $\sigma : D \to C$ consists of

- morphisms $\sigma_\beta : D_\beta \to C_\beta$ for $\beta < \alpha$ such that $\mathrm{tr}_\gamma^{\Sigma_\beta} \sigma_\beta = \sigma_\gamma$,
- functions $\sigma_i : V_i^D \to \mathrm{Term}_{\Sigma,i}(C)$ for $\dim i = \alpha$ satisfying for $\delta : j \to i$ that

$$\begin{array}{ccc} V_i^D & \xrightarrow{\sigma_i} & \mathrm{Term}_{\Sigma,i}\, C \\ \downarrow{\scriptstyle \phi_\delta^D} & & \downarrow{\scriptstyle \delta^*} \\ \mathrm{Term}_{\Sigma_{\dim j},j}\, D & \xrightarrow{\sigma_{\dim j}} & \mathrm{Term}_{\Sigma_{\dim j},j}\, C \end{array}$$

Morphisms of computads

Definition

A morphism $\sigma : D \to C$ consists of

- morphisms $\sigma_\beta : D_\beta \to C_\beta$ for $\beta < \alpha$ such that $\mathrm{tr}_\gamma^{\Sigma_\beta} \sigma_\beta = \sigma_\gamma$,
- functions $\sigma_i : V_i^D \to \mathrm{Term}_{\Sigma,i}(C)$ for $\dim i = \alpha$ satisfying for $\delta : j \to i$ that

$$\begin{array}{ccc} V_i^D & \xrightarrow{\sigma_i} & \mathrm{Term}_{\Sigma,i}\, C \\ \downarrow{\scriptstyle \phi_\delta^D} & & \downarrow{\scriptstyle \delta^*} \\ \mathrm{Term}_{\Sigma_{\dim j},j}\, D & \xrightarrow{\sigma_{\dim j}} & \mathrm{Term}_{\Sigma_{\dim j},j}\, C \end{array}$$

We will say that $\sigma : D \to C$ is variable-to-variable when σ_β are variable-to-variable and σ_i factors via var.

Composition

Given a morphism $\sigma : C \to D$, we define composition and the action on terms recursively by

$$\sigma \circ \tau = (\sigma_\beta \circ \tau_\beta, \mathsf{Term}_{\Sigma,i}(\sigma) \circ \tau_i)$$

where

$$\begin{aligned} \mathsf{Term}_{\Sigma,i}(\sigma)(\mathsf{var}\, v) &= \sigma_i(v) \\ \mathsf{Term}_{\Sigma,i}(\sigma)(\mathsf{comp}[f, \tau]) &= \mathsf{comp}[f, \sigma \circ \tau] \end{aligned}$$

The term adjunction

- The unit includes generators into terms

$$\begin{aligned}\eta_{\Sigma,X} : X &\to \mathsf{Term}_\Sigma\, \mathsf{Cptd}_\Sigma\, X \\ x &\mapsto \mathsf{var}\, x\end{aligned}$$

The term adjunction

- The unit includes generators into terms

$$\eta_{\Sigma,X} : X \to \mathsf{Term}_\Sigma \, \mathsf{Cptd}_\Sigma \, X$$
$$x \mapsto \mathsf{var}\, x$$

- The counit identifies terms with generators

$$\varepsilon_{\Sigma,C} : \mathsf{Cptd}_\Sigma \, \mathsf{Term}_\Sigma \, C \to C$$
$$\varepsilon_{\Sigma,C,\beta} = \epsilon_{\Sigma_\beta, C_\beta}$$
$$\varepsilon_{\Sigma,C,i} : V_i^{\mathsf{Cptd}_\Sigma \, \mathsf{Term}_\Sigma \, C} = \mathsf{Term}_\Sigma \, C$$

Algebras

Definition

The term monad $(\mathsf{M}_\Sigma, \eta_\Sigma, \mu_\Sigma)$ is the monad on $[\mathcal{I}_\alpha^{\mathsf{op}}, \mathsf{Set}]$ induced by the term adjunction. The category Alg_Σ is the category of M_Σ-algebras.

Algebras

Definition

The term monad $(\mathsf{M}_\Sigma, \eta_\Sigma, \mu_\Sigma)$ is the monad on $[\mathcal{I}_\alpha^{\mathsf{op}}, \mathsf{Set}]$ induced by the term adjunction. The category Alg_Σ is the category of M_Σ-algebras.

Algebras $\mathbb{X} = (X, u^{\mathbb{X}})$ are pairs of a presheaf and a morphism

$$u^{\mathbb{X}} : \mathsf{Term}_\Sigma\, \mathsf{Cptd}_\Sigma\, X \to X$$

satisfying two axioms.

Algebras

Definition

The term monad $(\mathsf{M}_\Sigma, \eta_\Sigma, \mu_\Sigma)$ is the monad on $[\mathcal{I}_\alpha^{\mathsf{op}}, \mathsf{Set}]$ induced by the term adjunction. The category Alg_Σ is the category of M_Σ-algebras.

Algebras $\mathbb{X} = (X, u^{\mathbb{X}})$ are pairs of a presheaf and a morphism

$$u^{\mathbb{X}} : \mathsf{Term}_\Sigma \, \mathsf{Cptd}_\Sigma \, X \to X$$

satisfying two axioms. They gives rise for every $f \in \Sigma_i$ to functions

$$f^{\mathbb{X}} : [\mathcal{I}_\alpha^{\mathsf{op}}, \mathsf{Set}](B_f, X) \to X_i$$
$$f^{\mathbb{X}}(\tau) = u^{\mathbb{X}}(\mathsf{comp}[f, \mathsf{Cptd}_\Sigma \, \tau])$$

and they are determined by them.

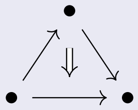
Table of Contents

Kan complexes

Notation

We will let $\mathsf{ssSet} = [\Delta_{\mathsf{inj}}^{\mathsf{op}}, \mathsf{Set}]$ and

- $\Delta[n]$ the representable semisimplicial set



Kan complexes

Notation

- $\partial\Delta[n]$ its boundary
- $\Lambda^k[n]$ its k-th horn

Definition

An algebraic semisimplicial Kan complex $\mathbb{X}$ is a semisimplicial set X together with for $n > 0$ and $0 \leq k \leq n$ a choice of lift for

$$\begin{array}{ccc} \Lambda^k[n] & \xrightarrow{\sigma} & X \\ \big\downarrow & \nearrow & \\ \Delta[n] & & \end{array}$$

$$\mathrm{face}_{k,n} : \mathsf{ssSet}(\Lambda^k[n], X) \to X_{n-1}$$

$$\mathrm{fill}_{k,n} : \mathsf{ssSet}(\Lambda^k[n], X) \to X_n$$

Kan Complexes

Kan complexes are algebras of a signature defined by

$$\Sigma_{\mathsf{Kan},[n]} = \{\mathsf{face}_{n+1,k} \ : \ 0 \leq k \leq n+1\} \cup \{\mathsf{fill}_{k,n} \ : \ n > 0, \ 0 \leq k \leq n\}$$

$$B_{\mathsf{face}_{k,n+1}} = \Lambda^k[n+1] \qquad \delta^* \,\mathsf{face}_{k,n+1} = \mathsf{var}(\delta_k \delta)$$

$$B_{\mathsf{fill}_{k,n}} = \Lambda^k[n] \qquad \delta^* \,\mathsf{fill}_{k,n} = \begin{cases} \mathsf{face}_{k,n}, & \text{if } \delta = \delta_k \\ \mathsf{var}\,\delta, & \text{otherwise.} \end{cases}$$

Kan Complexes

Kan complexes are algebras of a signature defined by

$$\Sigma_{\mathsf{Kan},[n]} = \{\mathsf{face}_{n+1,k} \ : \ 0 \leq k \leq n+1\} \cup \{\mathsf{fill}_{k,n} \ : \ n > 0, \ 0 \leq k \leq n\}$$

$$B_{\mathsf{face}_{k,n+1}} = \Lambda^k[n+1] \qquad \delta^* \,\mathsf{face}_{k,n+1} = \mathsf{var}(\delta_k \delta)$$

$$B_{\mathsf{fill}_{k,n}} = \Lambda^k[n] \qquad \delta^* \,\mathsf{fill}_{k,n} = \begin{cases} \mathsf{face}_{k,n}, & \text{if } \delta = \delta_k \\ \mathsf{var}\,\delta, & \text{otherwise.} \end{cases}$$

Remark

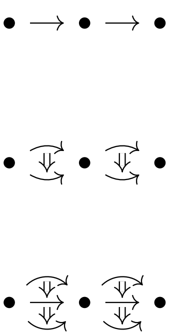
Algebraic semisimplicial Kan complexes carry a model structure equivalent to spaces[5]. We will discuss its cofibrations shortly.

[5] Bourke and Henry, *Algebraically cofibrant and fibrant object revisited*

Globular Higher Categories

Definition

We let $\mathsf{Glob} = [\mathbb{G}^{\mathsf{op}}, \mathsf{Set}]$ the category of globular sets. We let Bat the family of globular sets representing the strict ω-category monad.



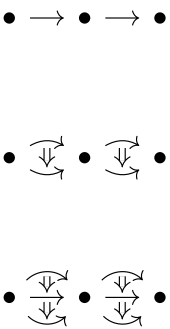
Globular Higher Categories

Definition

We let $\mathrm{Glob} = [\mathbb{G}^{\mathrm{op}}, \mathrm{Set}]$ the category of globular sets. We let Bat the family of globular sets representing the strict ω-category monad.

The signature $\Sigma_{\omega\,\mathrm{cat}}$ for weak ω-categories[6]

- has no operations of dimension 0,
- has as operations of dimension $n+1$ triples (B, a, b) where
  - $B \in \mathrm{Bat}$ of dimension at most $n+1$,
  - $a, b \in \mathrm{Term}_n(B)$ that "cover" the n-dimensional source and target of B respectively, and have common source and target.



[6] Dean et al., *Computads for weak ω-categories as an inductive type*
